Agenda

1. More ANOVA
2. ANOVA lab

ANOVA   Statisticians overload the term ANOVA. We use it when we are doing nested F-tests, when we are testing the significance of a categorical variable within a larger linear regression model, and we use it when we are just predicting a quantitative variable with a categorical one.

Just to get some intuition, lets compare the results from a few different approaches to using ANOVA.

```
require(mosaic)
bloodp = read.csv("http://www.math.smith.edu/~bbaumer/mth247/labs/bloodpress.csv")
m1 = lm(BP ~ Weight, data=bloodp)
anova(m1)

## Analysis of Variance Table

```

ANOVA lab For your convenience, here is the code from the ANOVA lab

```
require(mosaic)
require(Stat2Data)

data(FruitFlies)
head(FruitFlies)

tally(~Treatment, data=FruitFlies)

# Set the reference level
FruitFlies = FruitFlies %>%
  mutate(Treatment = relevel(Treatment, ref="none"))

d1plot = dotPlot(~Longevity, data=FruitFlies)
d2plot = dotPlot(~Longevity | Treatment, data=FruitFlies, layout=c(1,5))
# arrange the two plots horizontally
print(d1plot, position=c(0, 0, 0.5, 1), more=TRUE)
print(d2plot, position=c(0.5, 0, 1, 1))

b1plot = bwplot(~Longevity, data=FruitFlies)
b2plot = bwplot(~Longevity | Treatment, data=FruitFlies, layout=c(1,5))
# arrange the two plots horizontally
print(b1plot, position=c(0, 0, 0.5, 1), more=TRUE)
print(b2plot, position=c(0.5, 0, 1, 1))
```

```
gstats = favstats(Longevity ~ Treatment, data=FruitFlies)
gstats

fm.null = lm(Longevity ~ 1, data=FruitFlies)
summary(fm.null)
mean(~Longevity, data=FruitFlies)
fitted = fitted.values(fm.null)
ladd(panel.abline(v=coef(fm.null), col="red", lwd=3), plot=d2plot)

fm.aov = aov(Longevity ~ Treatment, data=FruitFlies)
summary(fm.aov)
model.tables(fm.aov)

fm.ref = lm(Longevity ~ Treatment, data=FruitFlies)
summary(fm.ref)
anova(fm.ref)
mean(Longevity~Treatment, data = FruitFlies) - mean(~Longevity, data = FruitFlies)

dotPlot(~Longevity | Treatment, data=FruitFlies, layout=c(1,5), panel=function(x,...){
  panel.dotPlot(x, ...)
  fitted = mean(x)
  panel.abline(v=fitted, col="red")
})

par(mfrow=c(2,2))
plot(fm.aov)
par(mfrow=c(1,1))

sd(Longevity~Treatment, data=FruitFlies)
max(sd(Longevity~Treatment, data=FruitFlies)) / min(sd(Longevity~Treatment, data=FruitFlies))

data(Hawks)
```
